The Leading Global Benchmark for Sustainable Supply Chains

Produced by the **MIT Sustainable Supply Chain Lab**, the report delivers rigorous, data-driven evidence on whether ESG commitments translate into real operational progress, insights unavailable anywhere else.

2026 Report:

In its seventh year, the report will examine how companies are using **industrial AI** to advance sustainability, capturing lessons from early adopters, the barriers they face, and the operational impact.

We will also assess the state of sustainable **logistics**, including adoption readiness and infrastructure gaps. Create a **sustainable maturity** index with the goal of comparative analysis on how sustainability maturity varies across regions, industries, and firm sizes.

The survey takes approximately *10 minutes* to complete, and participants have the option to express interest in being featured in the final report through an expert interview.
